

POST DERMAL FILLER CARE

- Post-procedure clients can expect swelling, redness and bruising, which can last from a few hours to up to a week or more.
- Once the swelling and bruising go down clients will be able to see the results right away, but it may take a week or so for the filler to fully settle in.
- Even though the results can last anywhere from four months to two or three years—depending on the fillers used and maintenance work—it's important to realize the limitations of injectables and fillers. While they can provide fullness, they can't lift or tighten sagging skin.
- The client is advised to refrain exposing to extremes of temperatures like sauna or skiing for 2 weeks.
- The client should also avoid large facial expressions, drinking from a straw, kissing, touching the treated area, and/or any vigorous activity for 6 hours following treatment.
- Advanced wrinkling cannot be reversed and a minimal improvement is predictable in persons with drug, alcohol and tobacco usage.
